25	Senior Financial Consultant	66%	$115,000	23

indeed

The second-best job is insurance broker, making its first appearance on our list this year. The insurance industry is hungry to attract new, young talent (https://www.npr.org/2016/03/15/470491091/insurance-industry-is-hiring-but-millennials-don-t-seem-to-be-interested), which is especially good news for millennial job seekers. Even better, a college degree is not required, though brokers must be licensed to practice.

Insurance is a broad field, encompassing everything from health to home to travel. Its brokers specialize in risk management and work independently of insurance companies, helping clients select the best possible options for loss protection. The average salary is well above baseline at $86,498, and three-year growth is an impressive 242%.

Following close behind, at number four, is another related job: insurance advisor. Contrary to brokers, advisors typically work directly for insurance companies, helping clients choose from available products.

With more than 90% of smartphone users using apps (https://www.ipsos.com/sites/default/files/2017-08/Google-mobile-apps-report-2017.pdf), it's no surprise that the role of full-stack developer remains in high demand — coming in third after ranking second on last year's list. Full-stack developers work on both the front end of web applications (the visual elements users interact with) and the back end (the coding and software that makes apps function).

With nowhere to go but up for app usage, full-stack developers can expect to rest easy. The job commands an impressive average salary of $114,316 and has grown 206% in terms of job postings over three years.

Legal jobs on the mend
